

# JIRA PROJECT DELIVERABLES

**Project Name:** Personal Subscription & Recurring Expense Auditor

**Deliverables**

- 1. EPICs
- 2. Burndown Charts

**Submitted by:** Aditya Vats (PES1UG24CS032, Section 5A)

**Date:** 7 September 2026

**Burndown Chart – SA Sprint 1**

## Burndown Chart – SA Sprint 2

## Reflection Questions

### 1. Did your estimations reflect the actual effort?

Ans) For the most part, yeah. The 8-point story (detecting recurring subscriptions) was genuinely the most involved one since it's the piece everything else depends on, while the 3-point stories were smaller, closer to a single action than a full feature. Splitting points on the Fibonacci scale instead of just picking round numbers made that difference between core logic and a one-off UI change pretty obvious.

### 2. Was your backlog well-prioritized?

Ans) Yeah, I'd say so. Detection and the burn rate calculation got marked High since nothing else really works without that data existing first, while manual correction, the cancellation guide, and the audit export stayed Medium since they only make sense once the core detection is already there. Sprint 1 versus Sprint 2 followed that same order too, foundation first, the outward-facing features after.

### 3. How did your simulated sprint align with your plan?

Ans) Not exactly how I planned it, honestly. The plan was to move something forward a little each day, but Sprint 1's burndown shows nothing changed for the first few days and then two stories got marked done back to back once I caught up. Sprint 2 slipped even more, it was originally scheduled for just two days but ended up running well past that because of a scheduling conflict mid-week. Both sprints technically finished, just not on the steady day-by-day pace I'd planned for.

### 4. What insights did the burndown chart give about your team's capacity?

Ans) Mainly that the chart doesn't lie about what actually happened, even when what happened wasn't the plan. Sprint 1's line sits flat for days and then drops almost straight down, which is an honest picture of delayed work getting rushed through at the end instead of steady progress. Sprint 2's chart shows the guideline reaching zero well before the actual remaining-work line caught up, which is basically the chart's way of flagging a sprint that ran over its planned window. On a real team, that's exactly the kind of pattern a burndown chart is supposed to catch, work piling up and then getting crammed in late.
